-i- FUNCTION: THIS PROTEIN BINDS TO 23S RIBOSOMAL RNA IN THE PRESENCE
OF PROTEIN L20 (BY SIMILARITY).

-i- SIMILARITY: BELLONGS TO THE L21P FAMILY OF RIBOSOMAL PROTEINS.
InterPro; IPR001787; Ribosomal_L21p.

The derivatives are useful as thrombolytic agents to treat arterial thrombosis and are pref. produced by eliminating at least one of the epitopes indicated in the features table. The epitopes are destroyed by replacing one or more amino acid residues in a charge cluster by an Ala residue. Mutations are introduced using site-directed mutagenesis on wild-type staphylokinase genomic DNA from the S. aureus SakSTAR staphylokinase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

isolated from Staphylococcus aureus. The method involves designing a series of overlapping test peptides having an amino acid sequence series of overlapping test peptides having an amino acid sequence corresponding to (1), modifying test peptides which are identified to comprise one or more T-cell epitopes, such that they are reduced or eliminated, and repeating the T-cell eliminating modifications for (1) to produce a modified peptide or protein. Methods from the present invention can be used for the treatment, diagnosis or prophylaxis or for the preparation of a pharmaceutical composition for the treatment, diagnosis or prophylaxis of a human subject. Staphylokinase is used as a potent thrombolytic agent in patients with acute myocardial infarction. The method is useful for reducing cell based immunogenicity of non-human proteins such as streptokinase or antibodies or their fragments, from ther species, for diagnostics and treatment of human disease. AAB99400 to AAB99440 represent amino acid sequences used in the exemplification.
                                                                                                                                                                                                                     present invention describes a method for reducing the immunogenicity
                                                                            Reducing immunogenicity of protein (P) by eliminating T cell epitopes in test peptides having amino acid sequence corresponding to (P) and modifying amino acid sequence of (P) according to test peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               61 EYYVEWALDATAYKEFRVVELDPSAKIEVTYYDKNKKKEETKSFPITEKGFVVPDLSEHI 120

Mutations are introduced using site-directed mutagenesis on wild-type staphylokinase genomic DNA from the S.aureus lysogenic strain SakSTAR. The present sequence is that of wild-type SakSTAR staphylokinase.

                                                                                                                                                                                                                The invention relates to a method of altering immunogenicity and/or increasing stability of a polypeptide of interest. The method comprises (a) expressing a diversified population of nucleotide sequences encoding a polypeptide of interest; (b) screening the polypeptides expressed for function, immunogenicity and/or stability; and (c) selecting functional polypeptides with altered immunogenicity and/or increased stability. The method is used to improve the properties of polypeptides, in particular to alter the immunogenicity and/or increase the functional in vivo halfilie of the polypeptide. The method uses a high throughput system that makes it possible to search several orders of magnitude more polypeptides
                                                                                                                                                                                                                                                                                                                             than is possible by previously known approaches. This enhances the chance of finding the optimal variant from the many thousands of variants that may be produced. The present sequence represents S. aureus staphylokinase variant sequence, used to exemplify the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           EYYVEWALDATAYKEFRVVELDPSAKIEVTYYDKNKKKEETKSFPITEKGFVVPDLSEHI 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                DNA encoding SAK lacking the signal peptide, is expressed intracellularly. This avoids the problem of fast degradation of polypeptides or destruction of the host when expressed into the medium or into the pertiplasm respectively. High expression is possible and the chemically induced overprodn. is easy to handle. Also, the prods. are homogeneous. Also, the prods. are homogeneous. sak-polypeptide derivs. are plasminogen activators for the treatment of thrombosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

The present sequence represents staphylokinase (SAK). The invention relates to seven specifically claimed staphylokinase mutants which are useful as thrombolytic agents. The mutants are: (2) a SAK mutant (D41N) in which the 14th Asp in the SAK which comprises 136 amino acids is replaced by Asn; (3) a SAK mutant (EBSQ) in which the 58th Glu in SAK is replaced by Ala; (5) a SAK mutant (K113A) in which the 86th Lys in SAK is replaced by Ser; (6) a SAK mutant (K38S) in which the 11th Lys in SAK is replaced by Ser; (6) a SAK mutant (E73Q) in which the 46th Glu in SAK is replaced by Glu; (7) a SAK mutant (D96E) in which the 69th Asp in SAK is replaced by Glu, and (8) a SAK mutant (K136A) in which the 109th Lys in SAK is replaced by Ala.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Staphylokinase; variant; immunogenic; specificity; derivative; cysteine; SakSTAR (K740); anti-thrombotic; fibrinolytic; cardiant; veterinary; Staphylococcus aureus; myocardial infarction; arterial thrombosis; monoclonal antibody; polyethylene glycol; PEG; plasma clearance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             61 EYYVEWALDATAYKEFRVVELDPSAKIEVTYYDKNKKKEETKSFPITEKGFVVPDLSEHI 120

                                                                                                                                                                                                                                                                                                                                                                      The present sequence is a specifically claimed Staphylokinase SakSTAR variant. This variant has one aminoacid that has been substituted by another aminoacid that reduces the reactivity with monoclonal contibodies and absorption of SakSTAR-specific antibodies from plasma of patients treated with staphylokinase. The derivatives can also be substituted with cysteine modified with PEG to maintain the specific activity and significantly reduce the plasma clearance. They have altered immunogenicity without markedly reducing the specific activity. This sequence has anti-thrombotic, cardiant activity and a fibrinolytic potency in human plasma. The new staphylokinase derivatives are used for treatment of arterial thrombosis, especially myocardial infarction. The compositions can be used in human or veterinary practice. The present sequence is not shown in the specification, but is derived from the Staphylococcus aureus wild type staphylokinase sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is a specifically claimed Staphylokinase SakSTAR variant. This variant has one aminoacid that has been substituted aninoacid that reduces the reactivity with monocidonal attribodies and absorption of SakSTAR. Specific antibodies from plasma of patients treated with staphylokinase. The derivatives can also be substituted with cysteine modified with pgG to maintain the specific activity and significantly reduce the plasma clearance. They have altered immunogenicity without markedly reducing the specific activity. This sequence has anti-thrombotic, cardiant activity and a fibrinolytic potency in human plasma. The new staphylokinase derivatives are used for treatment of arterial thrombosis, especially myocardial infarction. The compositions can be used in human or veterinary practice.

Note: The present sequence is not shown in the specification, but is derived from the Staphylococcus aureus wild type staphylokinase sequence
                                                                                                                                                                                                                                                                                                                                                                                                                       ô

The present sequence is a specifically claimed Staphylokinase SakSTAR variant. This variant has one aminoacid that has been substituted by another aminoacid that reduces the reactivity with monoclonal antibodies and absorption of SakSTAR-specific antibodies from plasma of patients treated with staphylokinase. The derivatives can also be substituted with systeic modified with PEG to maintain the specific activity and significantly reduce her plasma clearance. They have altered immunogenicity without markedly reducing the specific activity. This sequence has anti-thrombotic, cardiant activity and a fibrinolytic potency in human plasma. The new staphylokinase derivatives are used for treatment of arterial thrombosis, especially myocardial infarction. The compositions can be used in human or veterinary practice.

Note: The present sequence is not shown in the specification, but is derived from the Staphylococcus aureus wild type staphylokinase sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Staphylokinase; variant; immunogenic; specificity; derivative; cysteine; SakSTAR (V132A); anti-thrombotic; fibrinolytic; cardiant; veterinary; Staphylococcus aureus; myocardial infarction; arterial thrombosis; monoclonal antibody; polyethylene glycol; PEG; plasma clearance.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is a specifically claimed Staphylokinase SakSTAR variant. This variant has one aminoacid that has been substituted by another aminoacid that reduces the reactivity with monoclonal antibodies and absorption of SakSTAR-specific antibodies from plasma of patients treated with staphylokinase. The derivatives can also be substituted with cysteine modified with PEG to maintain the specific activity and significantly reduce the plasma clearance. They have altered immunogenicity without markedly reducing the specific activity. This sequence has anti-thrombotic, cardiant activity and a fibrinolytic potency in human plasma. The new staphylokinase derivatives are used for treatment of arterial thrombosis, especially myocardial infarction. The compositions can be used in human or veterinary practice. Note: The present sequence is not shown in the specification, but is derived from the Staphylococcus aureus wild type staphylokinase sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Staphylokinase; variant; immunogenic; specificity; derivative; cysteine;

potency in human plasma. The new staphylokinase derivatives are used for treatment of arterial thrombosis, especially myocardial infarction. The compositions can be used in human or veterinary practice. Note: The present sequence is not shown in the specification, but is derived from the Staphylococcus aureus wild type staphylokinase sequence given in figure 1.
The present sequence is a specifically claimed Staphylokinase SakSTAR variant. This variant has one aminoacid that has been substituted by another aminoacid that reduces the reactivity with monoclonal antibodies and absorption of SakSTAR-specific antibodies from plasma of patients treated with staphylokinase. The derivatives can also be substituted with cysteine modified with PBG to maintain the specific activity and significantly reduce the plasma clearance. They have altered immunogenicity without markedly reducing the specific activity. This sequence has anti-thrombotic, cardiant activity and a fibrinolytic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

This avoids the problem of fast degradation of polypeptides or destruction of the host when expressed into the medium or into the periplasm respectively. High expression is possible and the chantcally induced overprodn. is easy to handle. Also, the prods. are homogeneous.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Staphylo-kinase (SAK) sequences lacking sequences for signal peptide(s) - for prodn. of proteins used as plasminogen activators in thrombosis treatment, and monoclonal antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Score 711; DB 14;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             οy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   g
      The invention relates to a method of altering immunogenicity and/or increasing stability of a polypeptide of interest. The method comprises can swressing a diversified population of nucleotide sequences encoding a polypeptide of interest; (b) screening the polypeptides expressed for function, immunogenicity and/or stability; and (c) selecting functional polypeptides with altered immunogenicity and/or increased stability. The method is used to improve the properties of polypeptides, in particular to alter the immunogenicity and/or increase the functional in vivo half-consist of the polypeptide. The method uses a high throughput system that makes it possible to search several orders of magnitude more polypeptides to search several orders of magnitude more polypeptides. The mathod uses a high throughput system that may bossible by previously known approaches. This enhances the chance of finding the optimal variant from the many thousands of variants that may be produced. The present sequence represents S. aureus staphylokinase mature protein sequence, used to exemplify the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ô

A synthetic construct encoding the SAK-SMC fusion is used to transform E.coli or Bacillus subtilis. The SAK signal peptide directs extracellular secretion of the somatomedin C.

SAK-11 (AAR25468) is derived from its precursor, staphylokinase (SAK) represented in AAR28644, by tryptic cleavage of its 10 N-terminal amno acid residues. SAK-11 is useful as the active agent in an injectable treatment for thrombosis. Thrombolytic activity is demonstrated using a rabbit jugular vein thrombosis model. A clear decrease in fibrinogen is observed upon application of 0.9 mg SAK-11/849. Plasminogen activation is superior to that of SAK (no specific data given). Furthermore, SAK-11 has very low antigenicity as shown in a PCA study, against streptokinase and egg albumin controls, in

Patent No. 5801037
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Schlott, Bernhard
APPLICANT: Albrecht, Sybille
APPLICANT: Albrecht, Sybille
APPLICANT: Hartmann, Manfred
TITLE OF INVENTION: Expression of signal-peptide-free
TITLE OF INVENTION: Staphylokinases
NUMBER OF SEQUENCES: 40
                                                                                                                                                                                               Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          COMPUTER: IBM PC compatible

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 14, Application US/08852299;
Patent No. 6010897
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Benhow, Detlef
APPLICANT: Albrecht, Sybille
APPLICANT: Albrecht, Sybille
APPLICANT: Artuman, Manfred
TITLE OF INVENTION: Expression of signal-peptide-free
TITLE OF INVENTION: Staphylokinases
NUMBER OF SEQUENCES: 40
CORRESPONDENCE ADDRESS:
ADDRESSE: Fish & Neave
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           3; Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          COMPUTER: IBM PC compatible

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
